Joint Fusion Surgery: Purpose, Procedure, Risks, Recovery

A common surgical treatment of hip osteonecrosis is total hip replacement. If there is damage to the cartilage of the joint, then hip replacement is probably the best option. 2 While hip replacement works well, the replacements will wear out over time. This presents a significant problem in young patients diagnosed with hip osteonecrosis.

Hip Osteonecrosis Symptoms and Treatment

One cause of hip-joint pain is called femoroacetabular impingement (FAI). 1 This condition is often thought to be an early precursor to hip-joint arthritis and is characterized by the formation of bone spurs that surround the ball and socket hip joint. One of the treatments for FAI is to remove the bone spurs that surround the hip joint, a procedure called an osteoplasty.

Hip-Joint and Femoral Osteoplasty - Verywell Health

Hip replacement surgery results are often excellent. Most or all of your pain and stiffness should go away. Some people may have problems with infection, loosening, or even dislocation of the new hip joint. Over time, the artificial hip joint can loosen. This can happen after as long as 15 to 20 years. You may need a second replacement.
